

Epigenetic analyses and endocrine disruption: applicability in risk assessment

Carlos Guerrero-Bosagna, PhD
Associate Professor
Environmental Epigenetics Group Leader
Department of Integrative Biology,
Uppsala University, Sweden

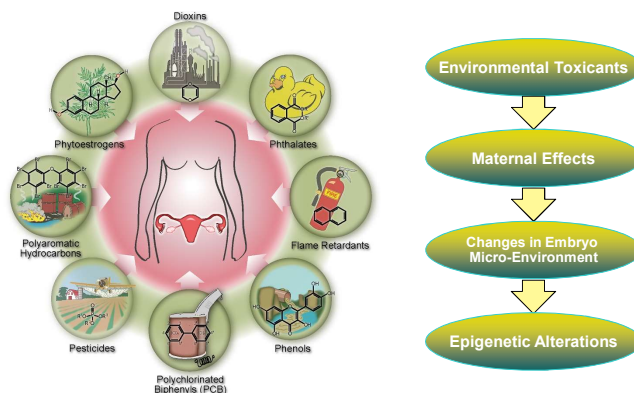

Endocrine Disruptors (WHO 2002 definition): "An exogenous substance or mixture that alters function(s) of the endocrine system and consequently causes adverse health effects in an intact organism, or its progeny , or (sub) populations"

Known effects of Endocrine Disruptors

From: Polina Lizunkova

Endocrine Disruptors can Influence Early Development

Epigenetics

Accessory chemical modifications on the DNA or on proteins that pack the DNA

DNA methylation: an epigenetic mechanism

Epigenetic changes regulate gene expression....

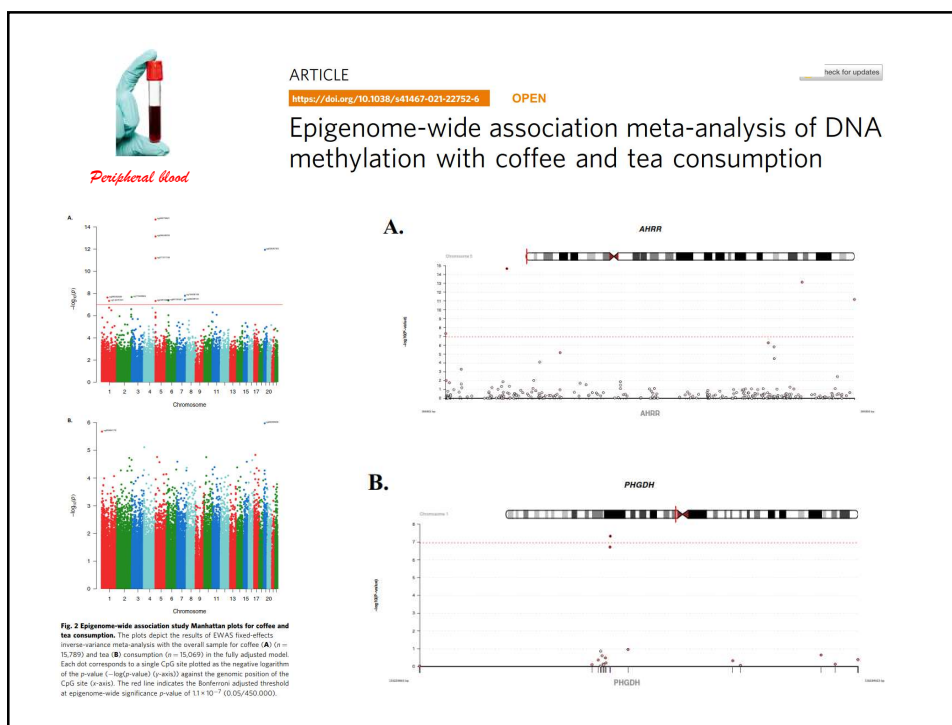

....and can survive cell division

Environmental Epigenetics

Examples of epigenetic markers of exposure in humans

Vinclozolin (Agricultural fungicide)

- Systemic fungicide (e.g. Wine Industry)
- Two metabolites: Butenoic acid and enanilide
- Vinclozolin and metabolites are **anti-androgenic**
- Late embryonic/early postnatal exposure causes abnormal reproductive tract development and gonadal function

Transgenerational Epigenetic Inheritance

TUNEL assay

Uzumcu et al., 2004, Reprod Tox

Herencia epigenética transgeneracional

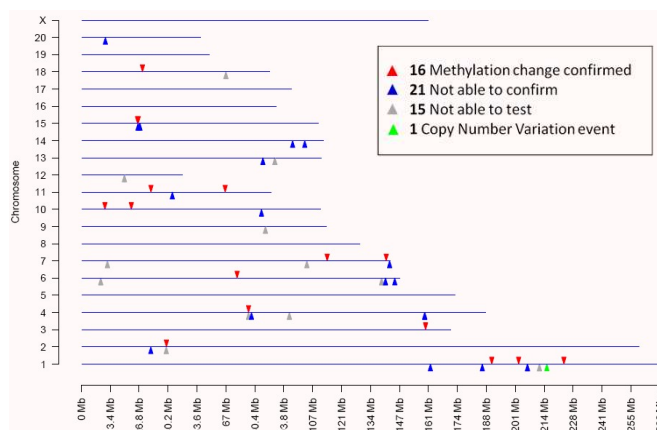

Epigenetic Transgenerational Actions of Vinclozolin on Promoter Regions of the Sperm Epigenome

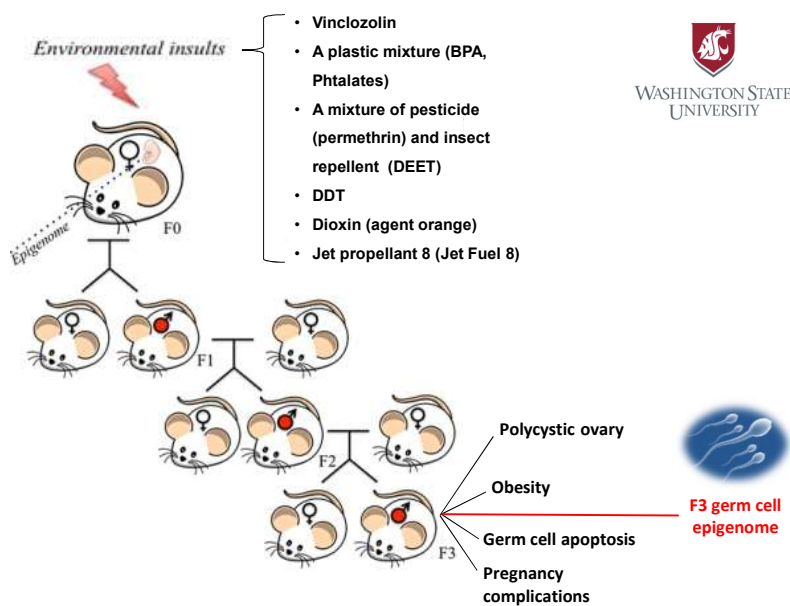

Carlos Guerrero-Bosagna, Matthew Settles, Ben Lucker, Michael K. Skinner*

PLoS ONE | September 2010 | Volume 5 | Issue 9 | e13100

52 Methylation Changes (48 promoters) in the sperm DNA of male rats 3 generations after a developmental exposure

Transgenerational Epigenetic Inheritance

Transgenerational Actions of Environmental Compounds on Reproductive Disease and Identification of Epigenetic Biomarkers of Ancestral Exposures

Mohan Manikkam^a, Carlos Guerrero-Bosagna^a, Rebecca Tracey, Md. M. Haque, Michael K. Skinner^a

PLoS ONE | February 2012 | Volume 7 | Issue 2 | e31901

Transgenerational differential DNA methylation regions (DMR) associated with exposures

B

Epigenetic biomarkers of exposure in hazard assessment

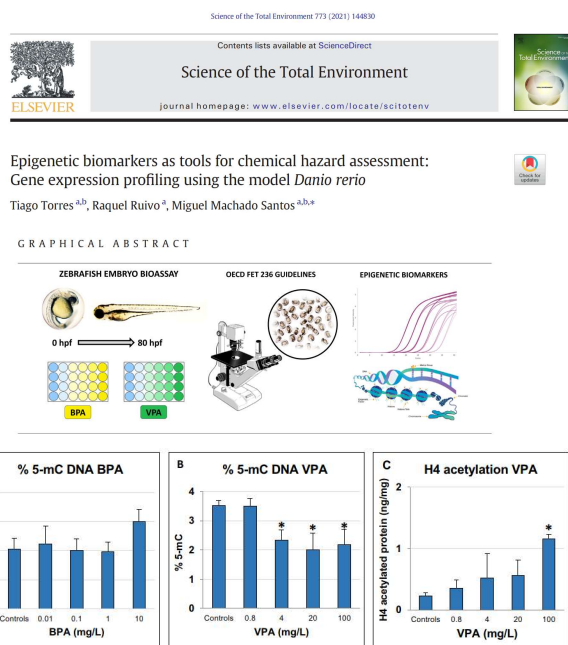

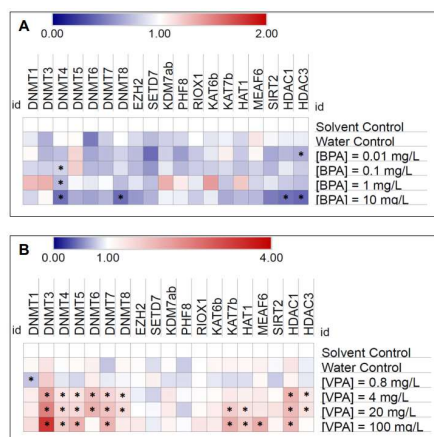

Fig. 1. Global DNA methylation and global H4 histone acetylation of *D. rerio* embryos exposed to different concentrations of BPA (A) and VPA (B and C) at 80hpf. Data are expressed as mean \pm SE ($n = 5$). Significantly different results from controls ($p < 0.05$) are marked with a symbol (*). One-way-ANOVA (A and C) or Kruskal-Wallis Test (B).

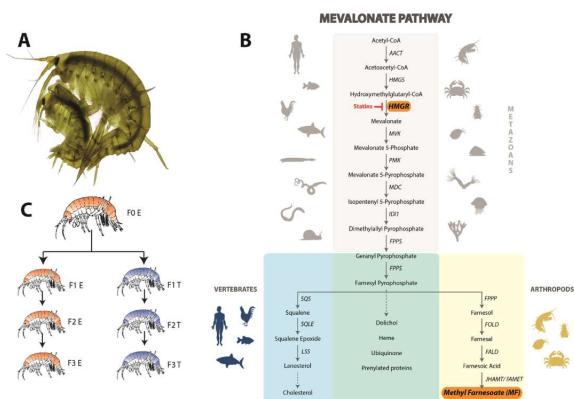

Epigenetic biomarkers as tools for chemical hazard assessment: Gene expression profiling using the model *Danio rerio*

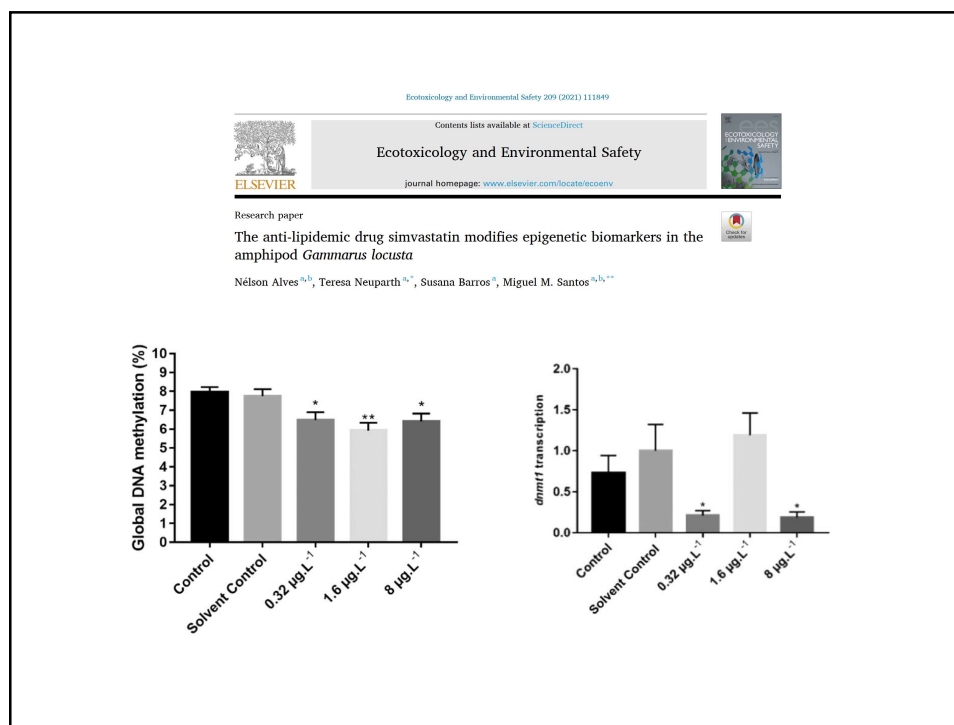

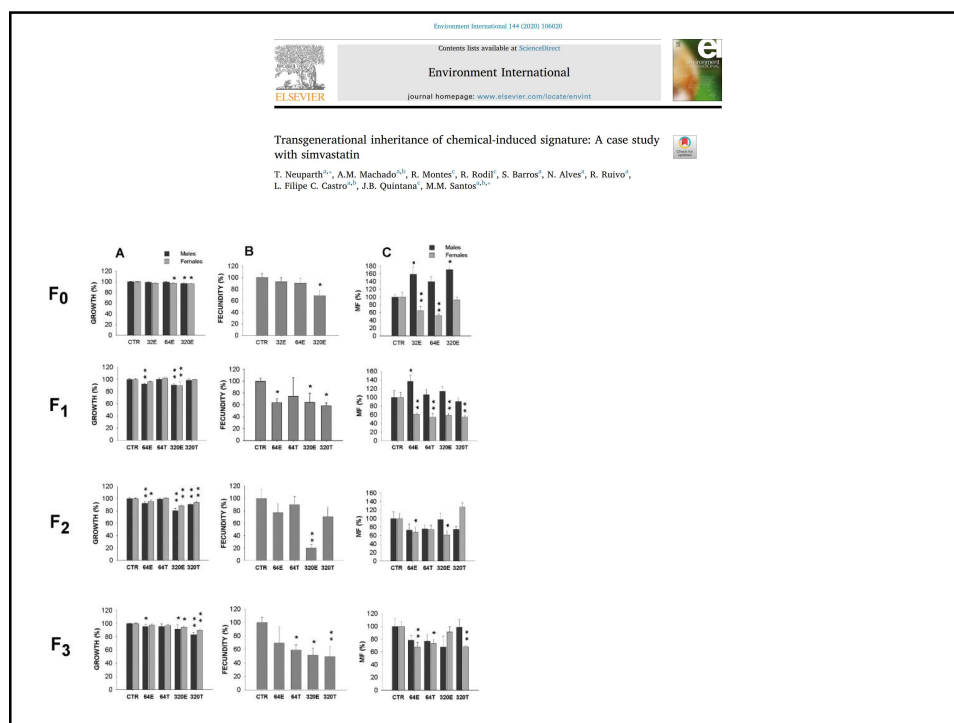

Tiago Torres ^{a,b}, Raquel Ruivo ^a, Miguel Machado Santos ^{a,b,*}

Transgenerational inheritance of chemical-induced signature: A case study with simvastatin

T. Neuparth ^{a,*}, A.M. Machado ^{a,b}, R. Montes ^a, R. Rodil ^a, S. Barros ^a, N. Alves ^a, R. Ruivo ^a, L. Filipe C. Castro ^{a,b}, J.B. Quintana ^a, M.M. Santos ^{a,b,c}

Epigenetic tools may fill gaps in risk assessment

- Chemical risk assessment currently involves hazard identification, dose-response assessment, exposure assessment, and risk characterization
- Although current guidelines include multigenerational effects of environmental pollutants, these are NOT integrated in hazard and risk assessment frameworks (Neuparth et al, 2020).
- Biomarkers of exposure for risk assessment analyses can indicate both life-long and transgenerational effects, as well as developmental and/or ancestral exposures
